Average Year For Arkansas Home Visiting

- **15,470** developmental screenings completed
- **90.4%** of Arkansas home visiting caregivers received depression screenings within three months of giving birth.
- **83.6%** of AR home visiting children receive well-child care visits compared to 71.2% national average.

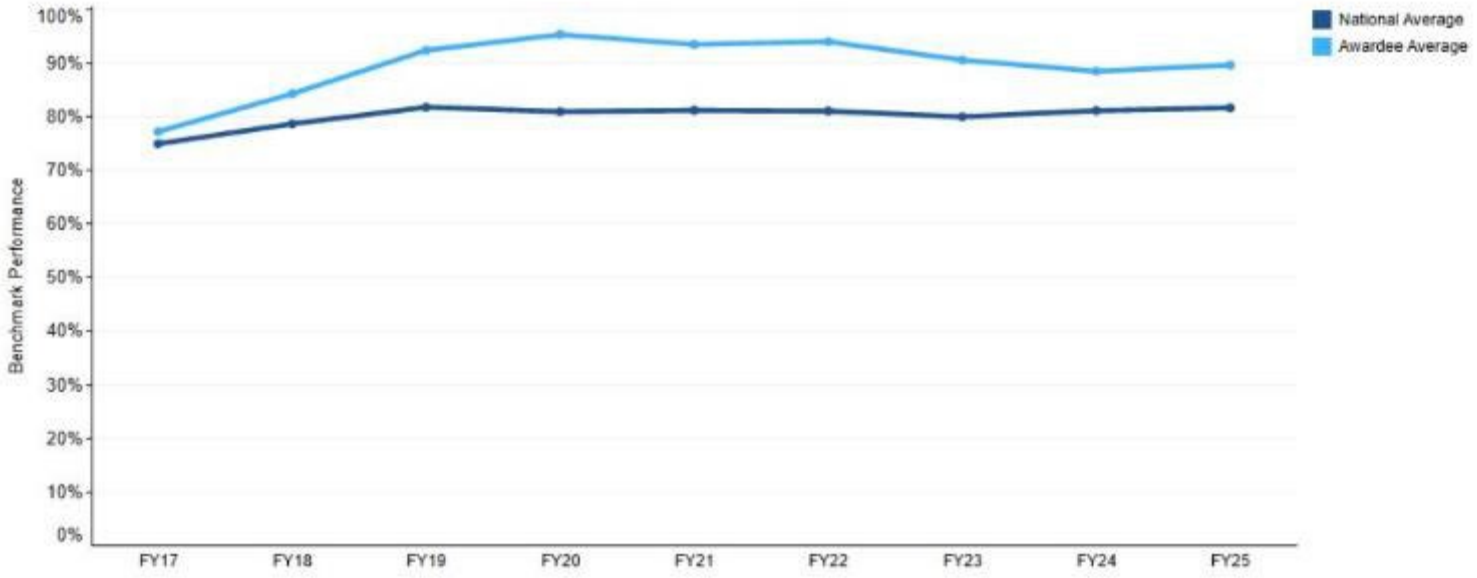

Federal/Arkansas MIECHV Benchmark Comparison

Depression Screening

Mental health conditions are a leading cause of death during pregnancy and up to one year postpartum. Postpartum depression is also associated with adverse outcomes for the infant, such as poor parent-child bonding and increased risk of developmental, health, and safety concerns for the child.

Percent of caregivers that were screened for depression within 3 months of enrollment or 3 months of delivery

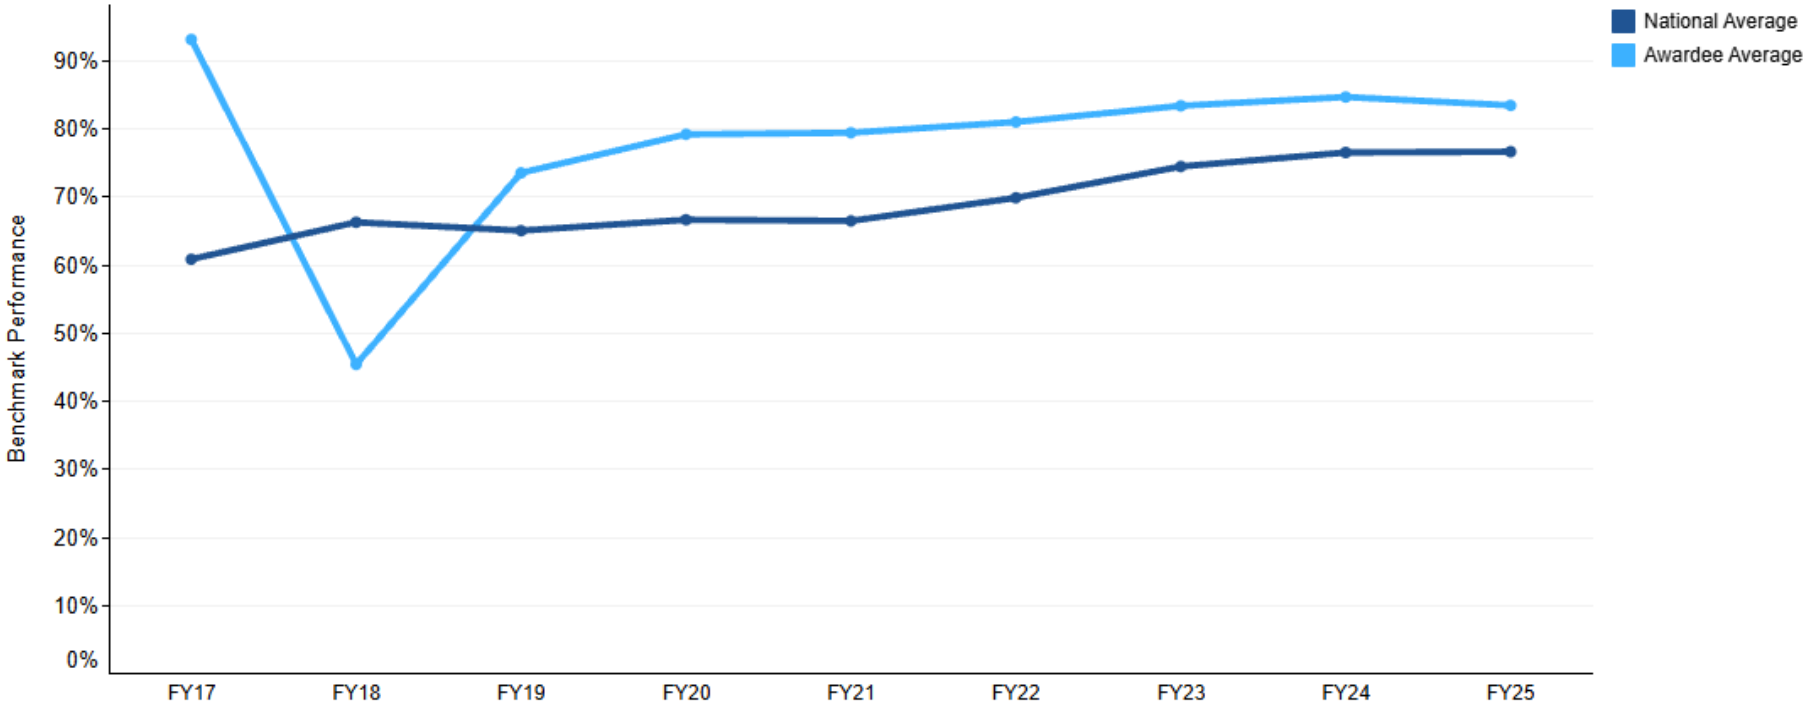

Benchmark Area: Maternal and Newborn Health

Benchmark Description: Percent of primary caregivers enrolled in home visiting who are screened for depression using a validated tool within 3 months enrollment (for those not enrolled prenatally) or within 3 months of delivery (for those enrolled prenatally)

Postpartum Care

Maternal deaths that happen in the postpartum period could be prevented with appropriate follow-up care. The postpartum visit is a chance for providers to monitor maternal and infant health, including preventing and treating complications from childbirth.

Percent of mothers that received a postpartum visit with a health care provider within 8 weeks of delivery

Coverage Areas

HIPPY ARKANSAS

HIPPY Program

parents as teachers

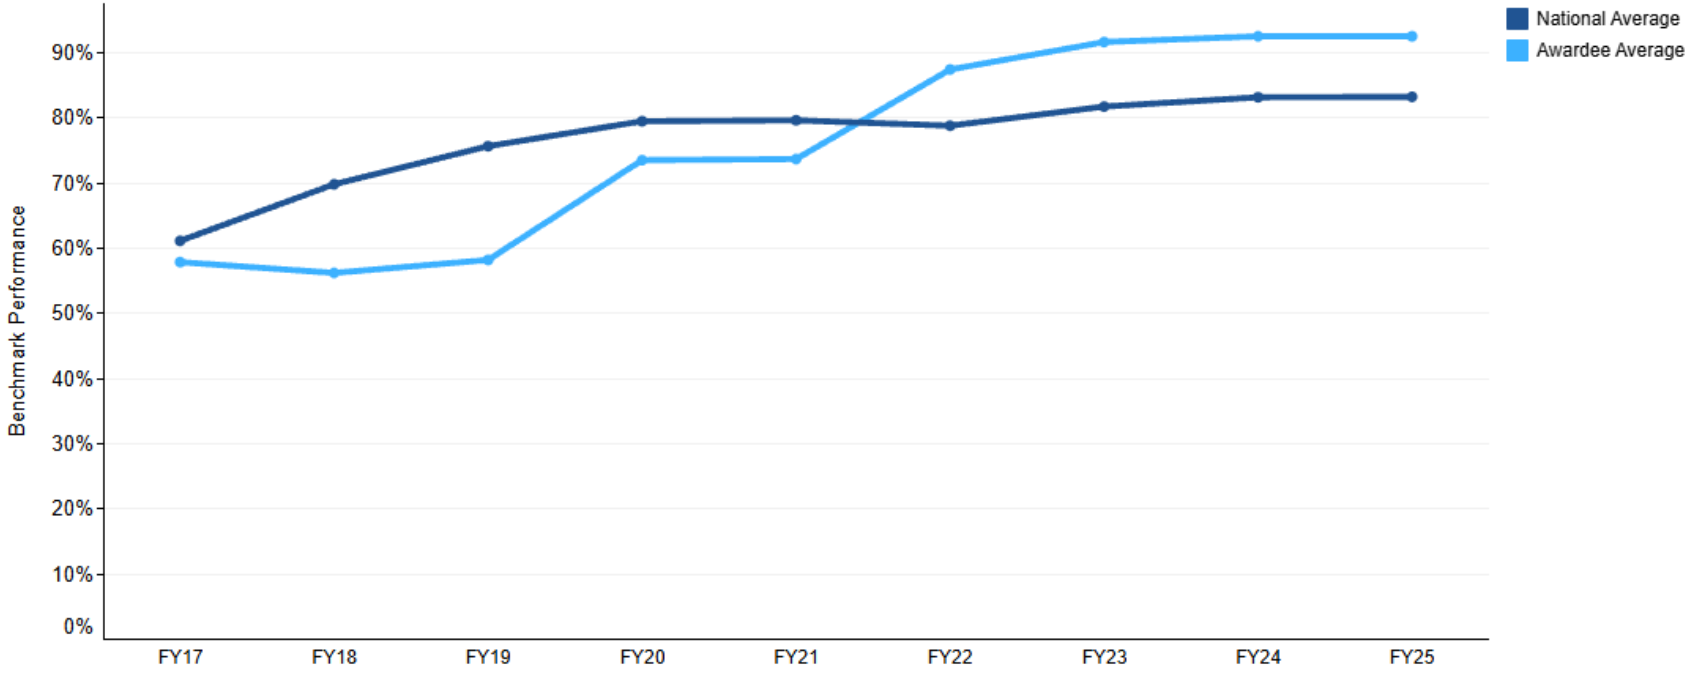

PAT Program

Early Language and Literacy Activities

Children whose caregivers speak to them frequently learn more words and have better literacy skills, which are linked to better academic, social, and cognitive functioning later in life.

Percent of children that had a family member who read, told stories, and/or sang with them on a daily basis

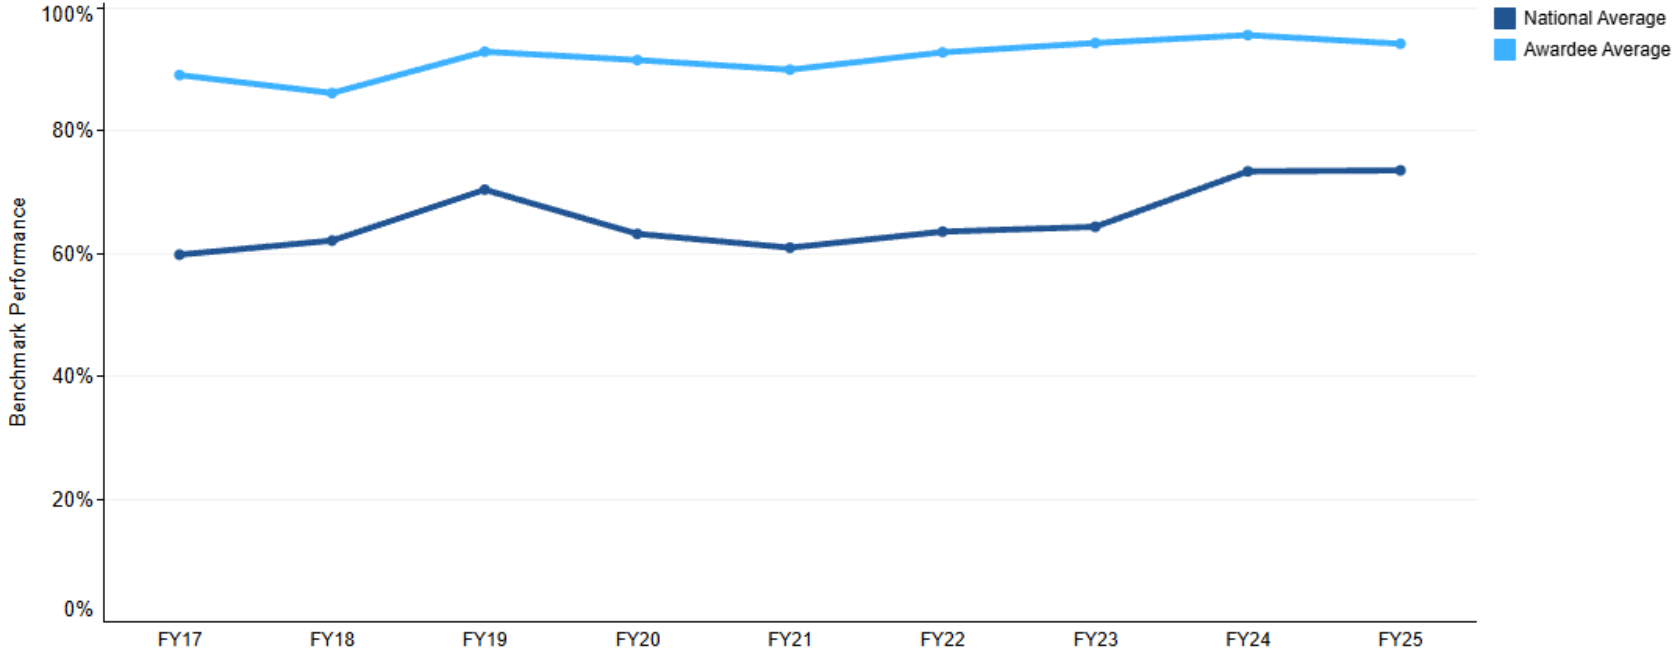

Benchmark Area: School Readiness and Achievement

Benchmark Description: Percent of children enrolled in home visiting with a family member who reported that during a typical week s/he read, told stories, and/or sang songs with their child daily, every day

Parent-Child Interaction

When parents interact with their child in ways that respond to their needs, children are more likely to be ready for school. It also helps children develop social skills, language, and can contribute to healthy brain development for infants and young children.

Percent of caregivers that received an observation of caregiver-child interaction by a home visitor using a validated tool

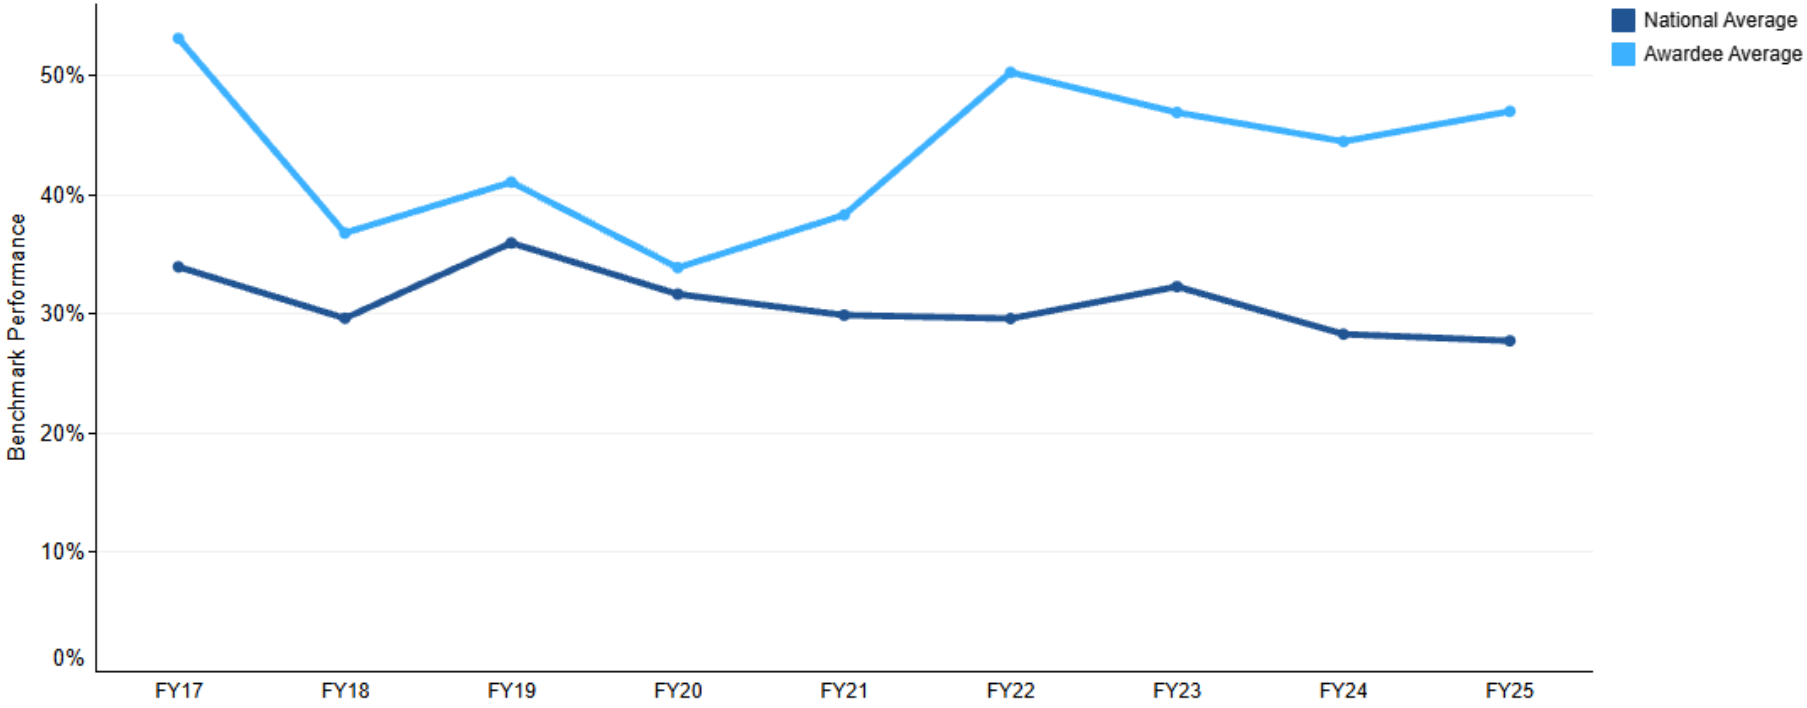

Benchmark Area: School Readiness and Achievement

Benchmark Description: Percent of primary caregivers enrolled in home visiting who receive an observation of caregiver-child interaction by the home visitor using a validated tool

Primary Caregiver Education

When caregivers get more education, it can help their children do better at school. The family also has a better chance of being financially stable, and caregivers are less likely to experience depression.

Percent of caregivers who enrolled in home visiting without a high school degree or equivalent that subsequently enrolled in or maintained continuous enrollment in middle school or high school or completed high school or equivalent
